Kanban Contribution

Name: Samuel Raju Parisa
Team name: GRAD_S03
Project: Adaptive Focus Studio

1. Board Identity and Policies

Project Name: Adaptive Focus Studio
Team Name: GRAD_S03
Contributor: Samuel Raju Parisa
Role: Individual Flutter application development, subject to instructor-approved project arrangement.

ClickUp Board URL: https://app.clickup.com/90141806593/v/b/2kydxm01-334

Workflow Statuses:

- To Do — Work planned but not started.
- In Progress — Work currently being implemented or reviewed.
- Complete — Work meeting its acceptance criteria and passing the relevant checks.

Work-in-Progress (WIP) Limit: Record the actual limit configured on the board. If no limit was configured, state that explicitly.

Definition of Done: A task is complete when its acceptance criteria have been met, the implementation has been checked, relevant tests or manual verification have been performed, and the result has been recorded in ClickUp.

Project Task Areas: Focus timer and presets, local storage and session history, smart focus recommendation, testing, and project documentation.

Evidence Note: This document will include genuine ClickUp board snapshots, task activity, code/commit references, test results, and a workflow reflection. Any unavailable historical evidence will be disclosed rather than recreated.

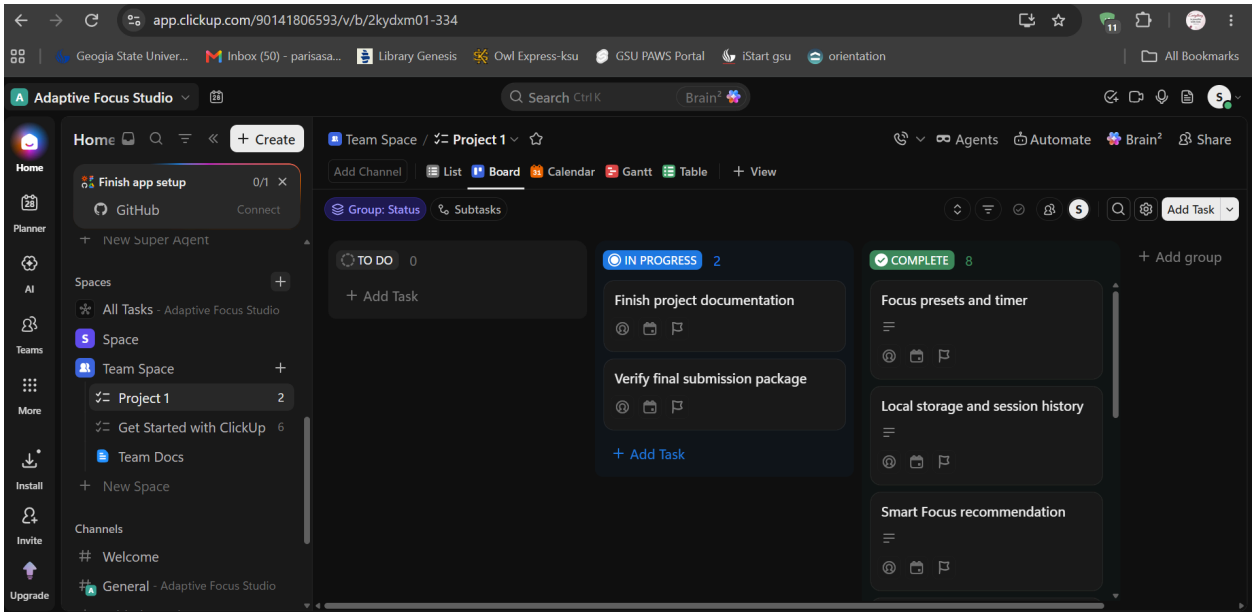

Figure 1. ClickUp Kanban Board — Adaptive Focus Studio

The board organizes project tasks into To Do, In Progress, and Complete. Tasks cover focus presets and the timer, local storage and session history, the smart focus recommendation, and final project documentation.

Capture date: October 28, 2026.

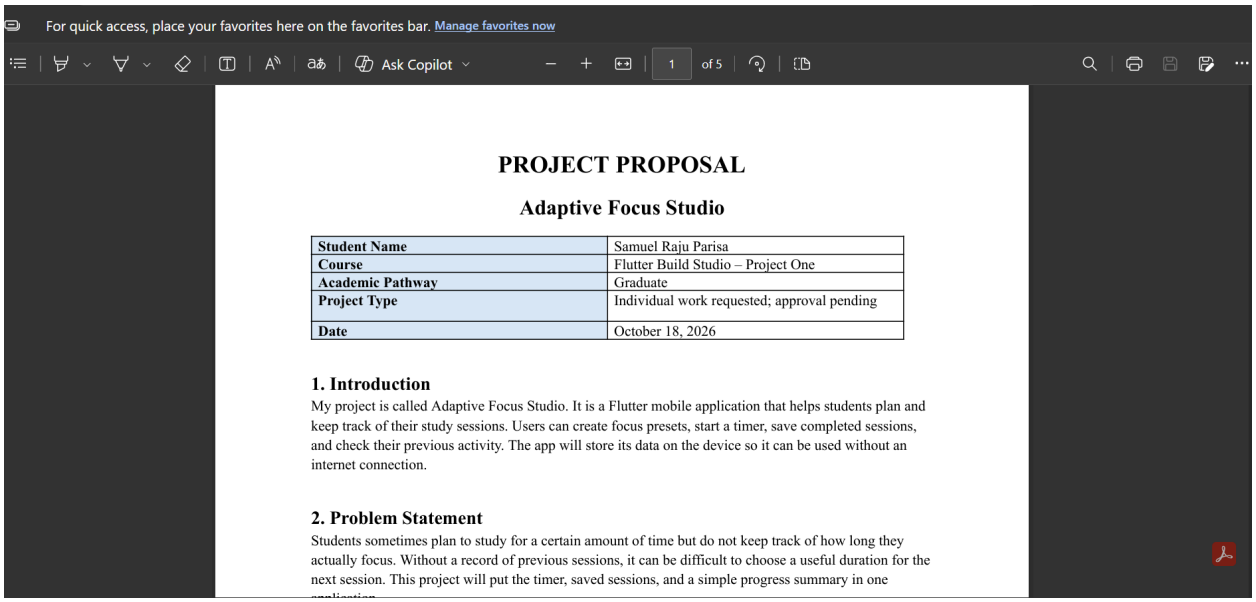

Figure 2: Project proposal captured on oct 16th 2026

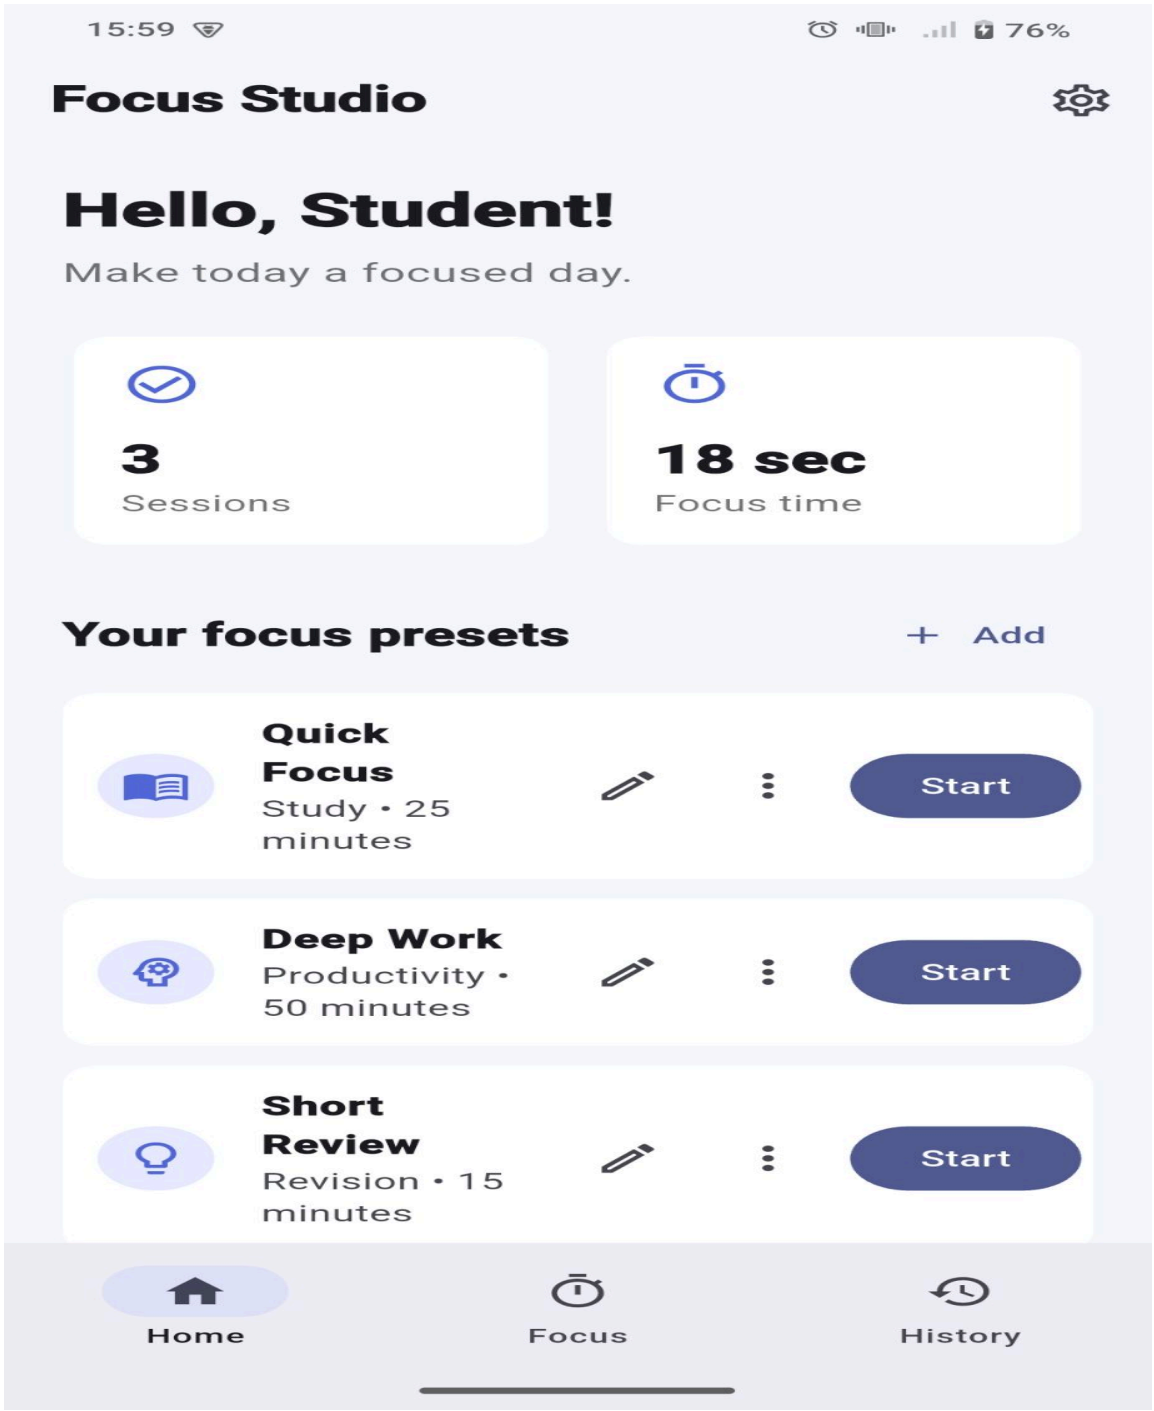

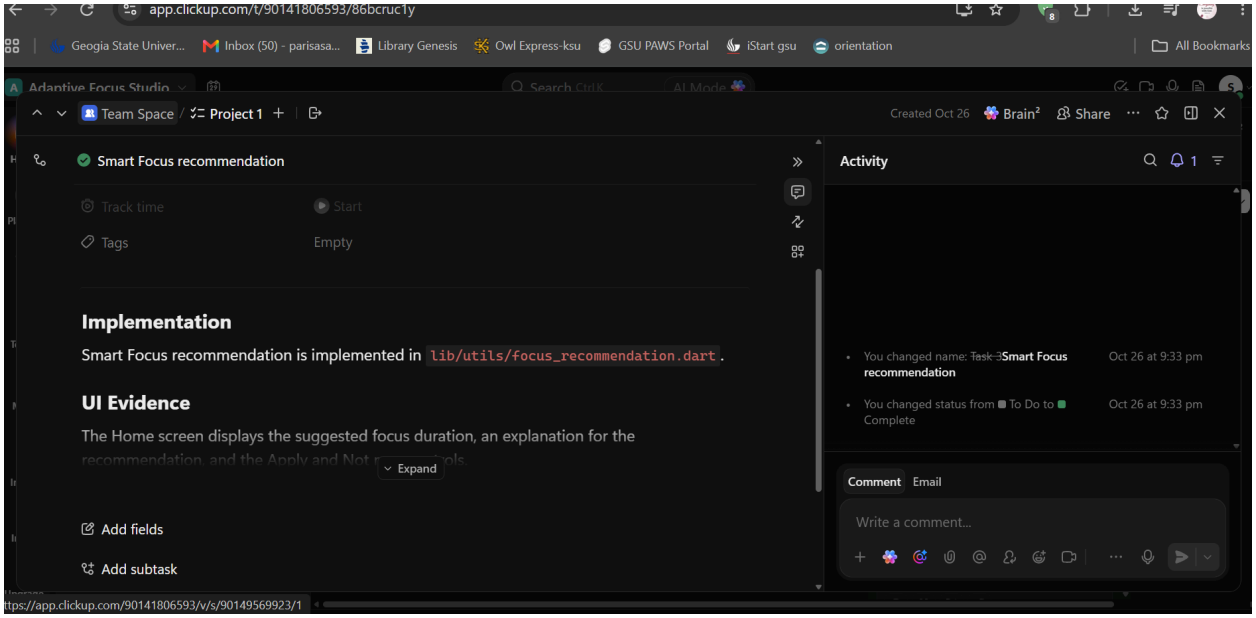

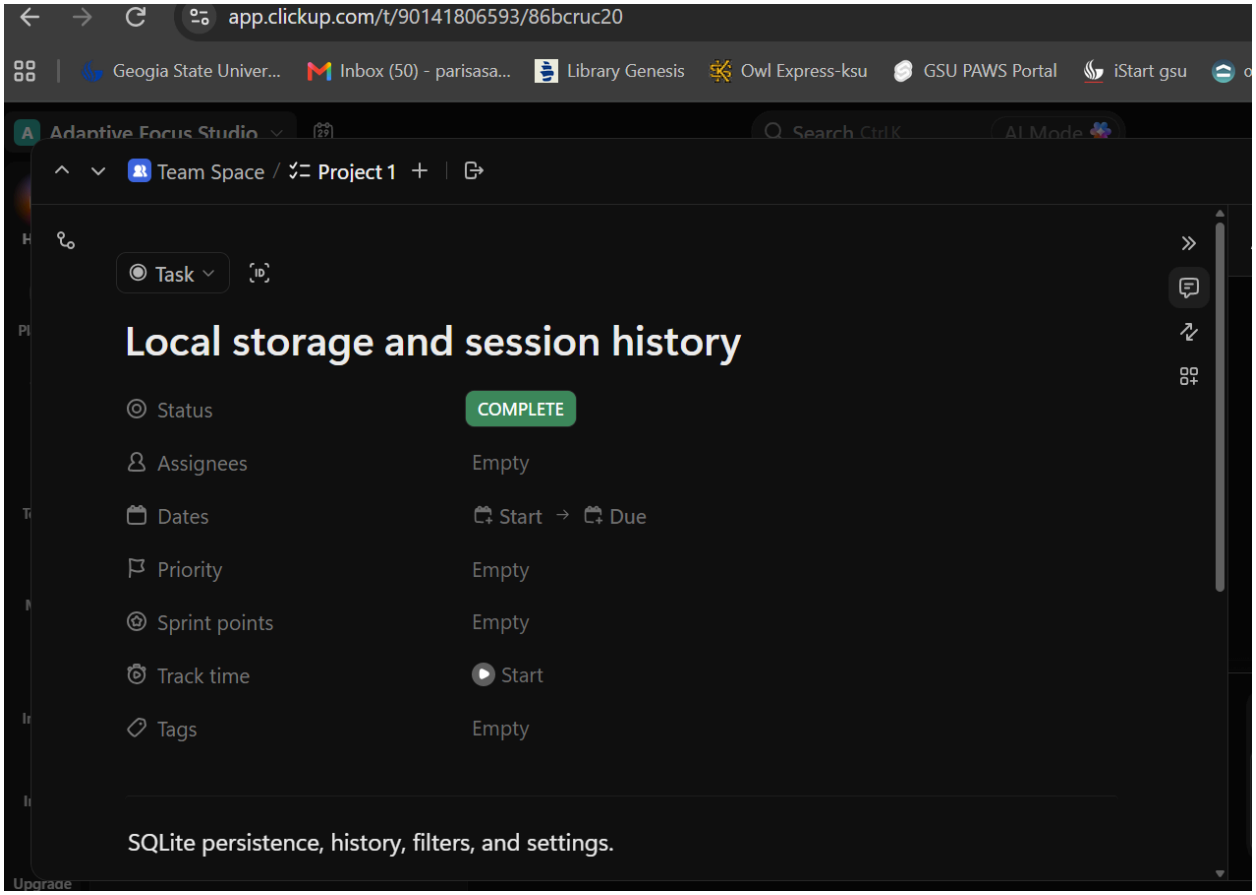

Figure3 : initial implementation added focus presets and focus captured on oct 18th 2026

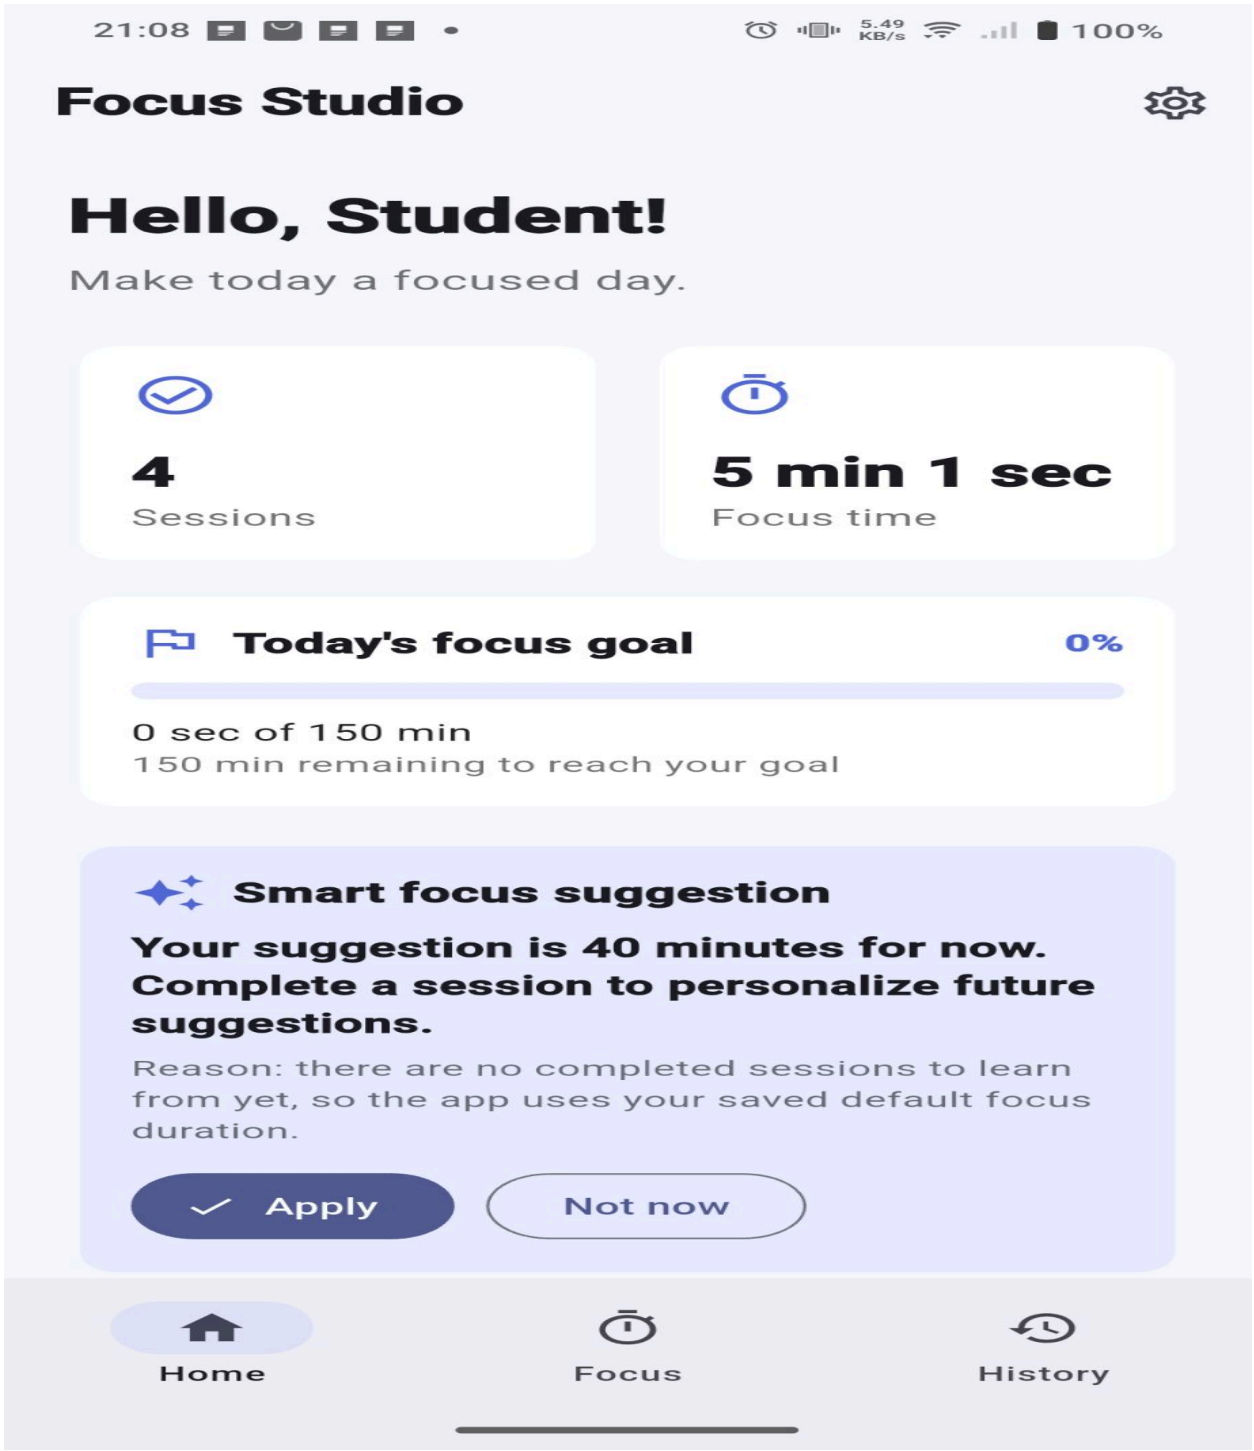

Captured on oct 26th 2026

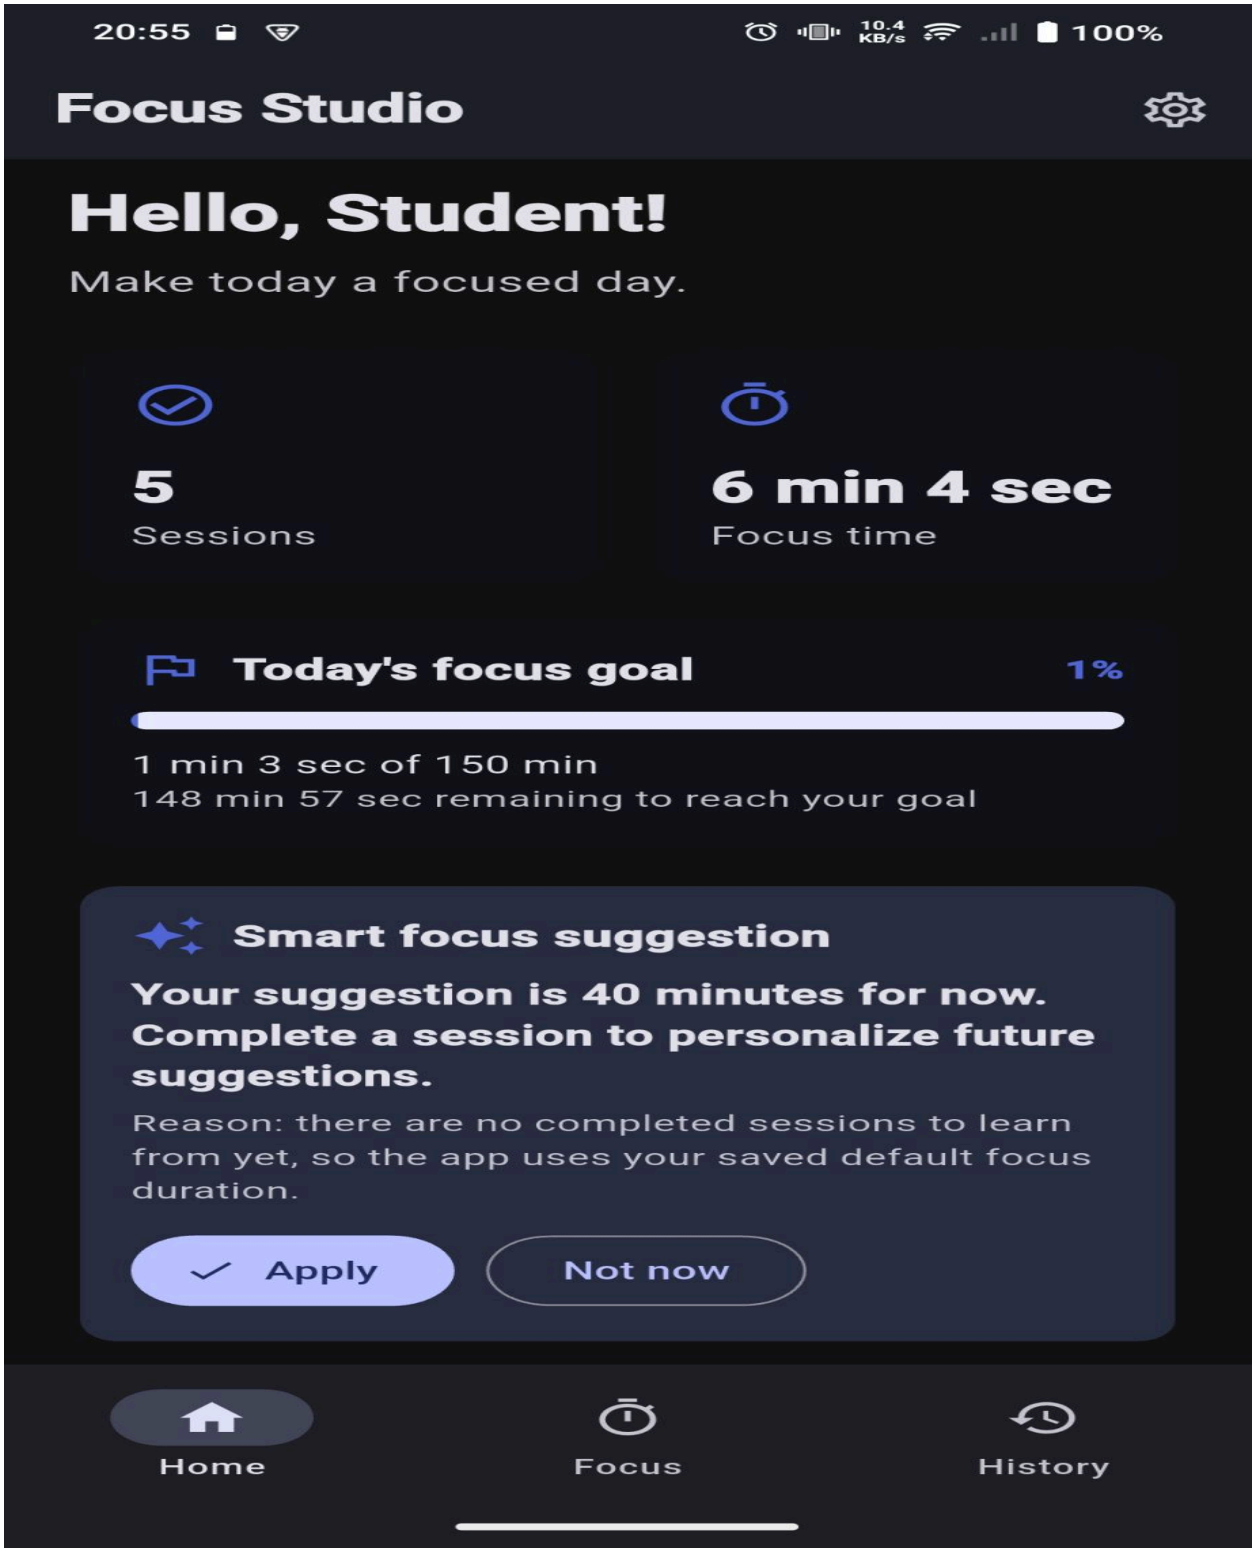

Added local persistence on oct 20th 2026

Added smart focus suggestion feature on oct 26th 2026

Added dark mode feature at last this is the last implementation.

3. Task-to-Build Traceability

Task 1: Focus Presets and Timer

Task status: Complete

Implementation scope: Preset CRUD, timer start/reset, and session flow.

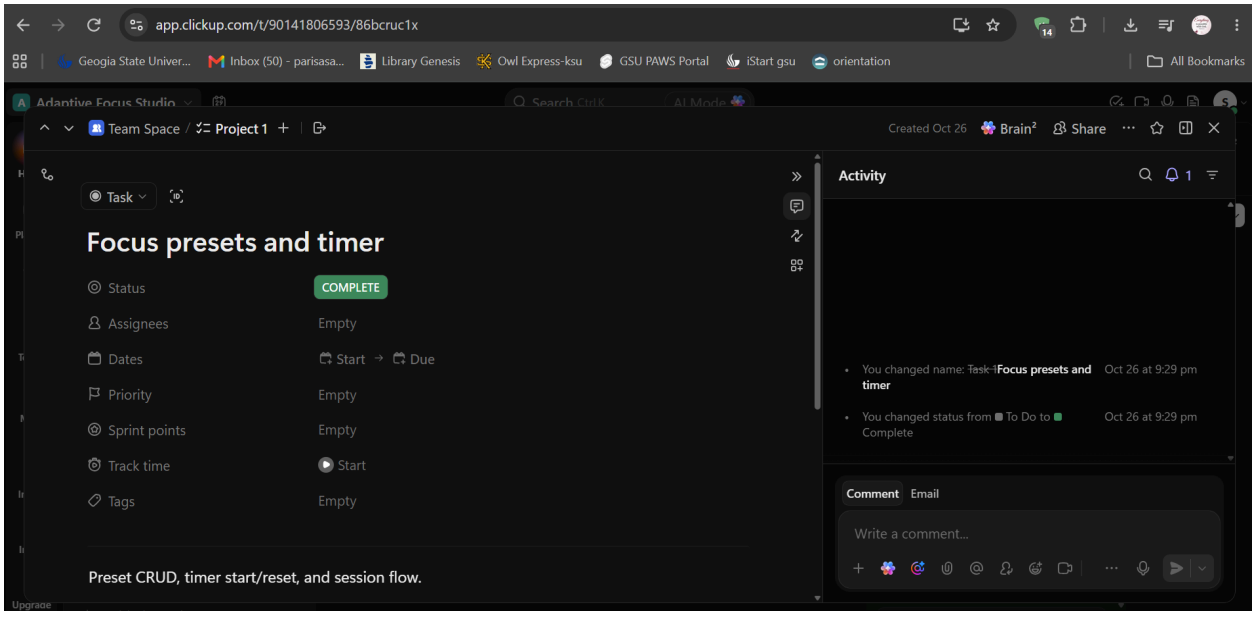

ClickUp activity: The task was renamed and moved from To Do to Complete on October 26, 2026, at 9:29 PM.

Acceptance criteria: Users can manage focus presets and use the focus timer's start/reset and session flow. Verify each behavior against the implemented application before marking it as satisfied.

Code reference: Add the actual GitHub file path or commit reference for the implementation.

Test evidence: Add the actual test name, test result, or manual verification evidence. Do not claim a test passed unless you ran it.

Evidence limitation: The visible ClickUp activity confirms a status change, but this screenshot alone does not establish the implementation commit or test result.

Analyzing adaptive_focus_studio... .
No issues found! (ran in 3.2s) more information.
PS C:\Users\s\Desktop\inc1\adaptive_focus_studio> flutter test
00:05 +6: All tests passed!

Task 2: Smart Focus Recommendation

Task ID: Retrieve the actual task ID from ClickUp.
Owner: Confirm the actual assignment.
Status: Complete.
Acceptance criteria: The application provides a focus-duration recommendation based on the implemented recommendation logic and available session history.

ClickUp activity: The task was renamed and moved from To Do to Complete on October 26, 2026, at 9:33 PM.

Code reference: `lib/utils/focus_recommendation.dart` (visible in the ClickUp task description; verify the file exists in the repository).

Test/review result: Record the actual test or manual verification result. Include evidence that the recommendation works and explain the fallback behavior if no completed sessions are available.

Completion evidence: Include the ClickUp task screenshot, code/commit reference, and genuine test or application evidence.

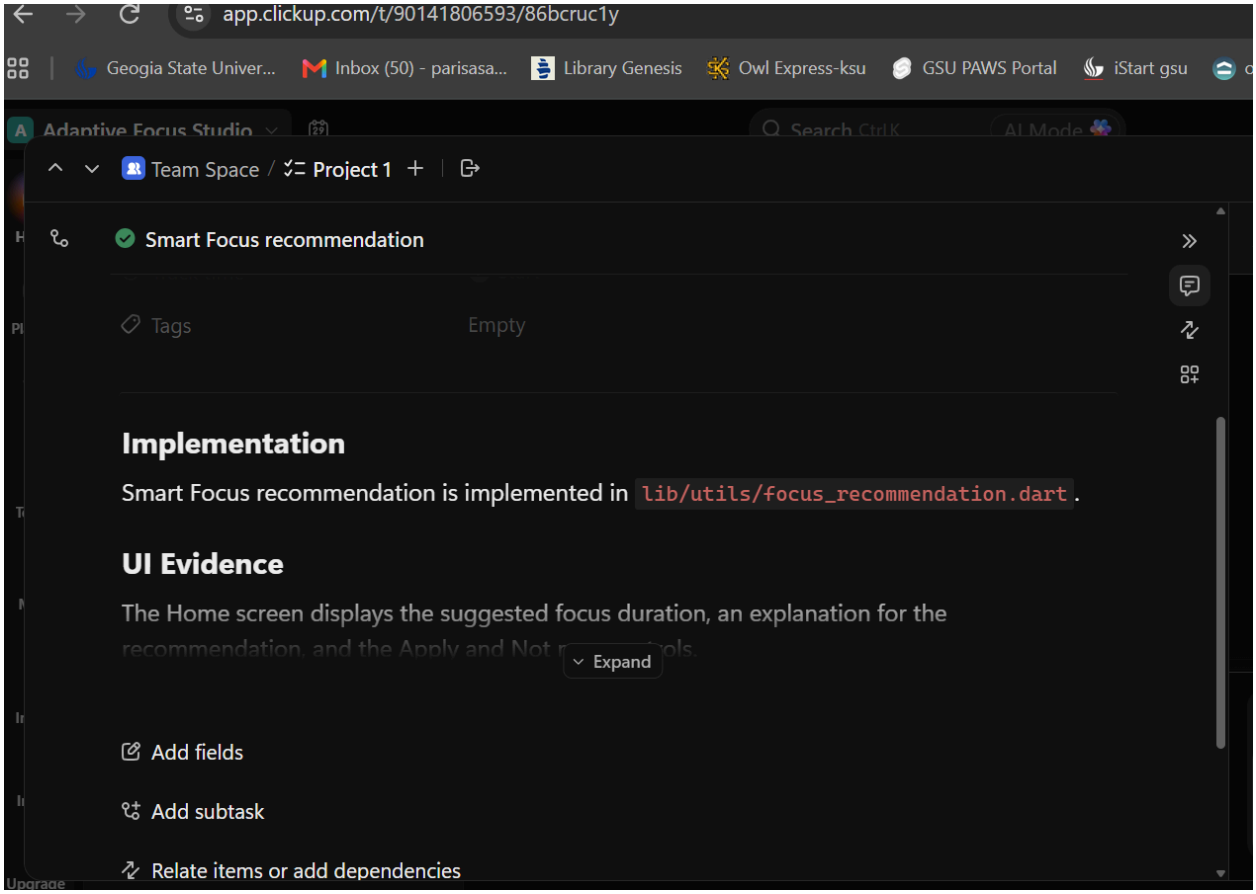

Project-Wide Coverage

Local CRUD: Provide code and test evidence for create, read, update, and delete operations for both required local database entities, including parent-delete behavior where applicable.

Smart helper: Provide the recommendation implementation, a representative test case, its result, and any known limitation.

Testing: Include the actual test command, execution date, result, and relevant test output.

Evidence integrity: ClickUp status alone does not establish that implementation and testing requirements passed. Each completion claim must be supported by actual code, commit, and test/review evidence.

4. Flow and Reflection

4.1 Dated Workflow Sample

The ClickUp board uses three workflow statuses: To Do, In Progress, and Complete. The visible task activity records the following status changes on October 26, 2026:

- **9:29 PM:** Focus presets and timer moved from To Do to Complete.
- **9:33 PM:** Smart Focus recommendation moved from To Do to Complete.

These activity records demonstrate status transitions. They do not, by themselves, establish when the underlying code was written or tested.

4.2 Blocker or Review Decision

No significant blocker or formal review decision was recorded in the available evidence.

4.3 Individual Contributions

Contributor: Samuel Raju Parisa

Describe the work you personally completed, such as focus timer implementation, preset management, local session history, smart recommendation logic, UI development, testing, and documentation. Include only work you actually performed and support it with code or other available evidence.

4.4 Workflow Improvement

Improvement proposed: Record acceptance criteria, code/commit references, and test results in each ClickUp task before marking it Complete.

Expected benefit: Improve traceability between planned work, implementation, and verification.

Observed result: This improvement has been identified as a future workflow change. It has not yet been verified through a completed task record, so no measured improvement is claimed.

Limitation: The available board screenshots show task status changes but do not establish a complete task-to-code-to-test history. Additional records are needed to demonstrate full traceability.
